

Facelift for Inspection Pipes

Modification of all inspection pipes with round opening

So far, the round inspection pipes have had completely circular covers, which were flat on the outside. Seen from the inside, the inspection pipe formed a depression in the wall of the down pipe – in accordance with the standards and proven over decades.

However, even proven products can be optimised. At individual customers' suggestion, Düker modified the cover shape so the inside contour of the pipeline is as smooth as possible. Now it is completely impossible e.g. for a smartphone that fell into the toilet to get caught here and to cause an obstruction. At the same time the smooth inside contour can further optimise acoustic protection.

The sealing is now neatly chambered. This ensures the necessary tensioning of the sealing without exceeding its elasticity limits – for higher performance and life expectancy of the sealing and guaranteed leak tightness even at higher pressure rates.

From December 2016, the production of Düker inspection pipes with round opening of all diameters and coatings will be changed to the new version. This applies to standard inspection pipes, but also to all bends and branches with round inspection openings.

The item numbers of the complete inspection pipes will not change. After the existing stocks of the previous version have been used up, you will automatically receive items of the new type.

previous version

new version

If the cover of an "old" inspection pipe needs to be replaced, the new cover cannot be used!

Therefore, covers and sealings for the "old" inspection pipes with round opening will still be available as spare parts. Please use the following item numbers for your orders:

Inspection pipe round	DN	complete fitting	previous version					new version					
			spare parts set	single item numbers*				spare parts set	single item numbers*				
			cover	sealing	bolt	nut	cover	sealing	bolt	washer	nut
